Answer: B

Explanation:

Explanation

Explanation/Reference:

* A unique local address (ULA) is an IPv6 address in the block fc00::/7, defined in RFC 4193. It is the approximate IPv6 counterpart of the IPv4 private address.

The address block fc00::/7 is divided into two /8 groups:

/ The block fc00::/8 has not been defined yet.

/ The block fd00::/8 is defined for /48 prefixes, formed by setting the 40 least-significant bits of the prefix to a randomly generated bit string.

* Prefixes in the fd00::/8 range have similar properties as those of the IPv4 private address ranges:

/ They are not allocated by an address registry and may be used in networks by anyone without outside involvement.
/ They are not guaranteed to be globally unique.
/ Reverse Domain Name System (DNS) entries (under ip6.arpa) for fd00::/8 ULAs cannot be delegated in the global DNS.
