NEW QUESTION: 3
Which of the following are restricted to 64-bit block sizes? (Select TWO).
A. AES
B. 3DES
C. RSA
D. PGP
E. AES256
F. DES
Answer: B,F
Explanation:
B. The Data Encryption Standard (DES) has been used since the mid-1970s. It was the primary standard used in government and industry until it was replaced by AES. It's based on a 56-bit key and has several modes that offer security and integrity. It is now considered insecure because of the small key size.
E. Triple-DES (3DES) is a technological upgrade of DES. 3DES is still used, even though AES is the preferred choice for government applications. 3DES is considerably harder to break than many other systems, and it's more secure than DES. It increases the key length to 168 bits (using three 56-bit DES keys).
Incorrect Answers:
A. International Data Encryption Algorithm (IDEA) was developed by a Swiss consortium. It's an algorithm that uses a 128-bit key.
This product is similar in speed and capability to DES, but it's more secure. IDEA is used in Pretty Good Privacy (PGP), a public domain encryption system used by many for email.
C. AES256 (also often written as AES-256) uses 256 bits instead of 128.
D. RSA is not restricted to 64-bit keys. 1024 and 2048 bit keys can be used, for example.
F. AES supports key sizes of 128, 192, and 256 bits, with 128 bits being the default.

NEW QUESTION: 4
Refer to the exhibit. An administrator pings the default gateway at 10.10.10.1 and sees the output as shown. At which OSI layer is the problem?

A. application layer
B. network layer
C. data link layer
D. session layer
E. access layer
Answer: B
Explanation:
Explanation/Reference:
Explanation:
The command ping uses ICMP protocol, which is a network layer protocol used to propagate control message between host and router. The command ping is often used to verify the network connectivity, so it works at the network layer.
