**Answer: D**

**NEW QUESTION: 2**

Which option best describes Attribute-based tunneling on the Cisco ASR 5000?

- A. Attribute-based tunneling uses attributes from a RADIUS access accept message to determine which LAC service to forward subscriber traffic to
- B. Attribute-based tunneling uses attributes received in the LCP phase to determine which LNS subscriber traffic will be forwarded to
- C. Attribute-based tunneling checks for the L2TP tunnel type option in the subscriber profile to determine which LAC service to forward subscriber traffic to
- D. Attribute-based tunneling uses attributes received from the LAC service to determine which LNS subscriber traffic will be forwarded to

**Answer: A**

### **NEW QUESTION: 3**

HOTSPOT

Your network contains an Active Directory domain named contoso.com.

You have a comma separated value (CSV) file named Users.txt. Users.txt contains the information for 500 users and all of the attributes required to create user accounts.

You plan to automate the creation of user accounts by using the Users.txt file.

You need to identify which two cmdlets you must run. The solution must pipe the output from the first cmdlet to the second cmdlet.

What should you run from Windows PowerShell? To answer, configure the appropriate PowerShell command in the answer area.

**Answer:**

Explanation:

### **NEW QUESTION: 4**

Which of the following protocol is developed jointly by VISA and Master Card to secure payment transactions among all parties involved in credit card transactions on behalf of cardholders and merchants?

- A. S/HTTP
- B. SET
- C. SSH
- D. S/MIME

**Answer: B**

Explanation:

Explanation/Reference:

Secure Electronic Transaction(SET) is a protocol developed

jointly by VISA and Master Card to secure payment transaction among all parties involved in credit card transactions among all parties involved in credit card transactions on behalf of cardholders and merchants. As an open system specification, SET is an application-oriented protocol that uses trusted third party's encryption and digital-signature process, via PKI infrastructure of trusted third party institutions, to address confidentiality of information, integrity of data, cardholders authentication, merchant authentication and interoperability.

The following were incorrect answers:

S/MIME - Secure Multipurpose Internet Mail Extension (S/MIME) is a standard secure email protocol that authenticates the identity of the sender and receiver, verifies message integrity, and ensures the privacy of message's content's, including attachments.

SSH -A client server program that opens a secure, encrypted command-line shell session from the Internet for remote logon. Similar to a VPN, SSH uses strong cryptography to protect data, including password, binary files and administrative commands, transmitted between system on a network. SSH is typically implemented between two parties by validating each other's credential via digital certificates. SSH is useful in securing Telnet and FTP services, and is implemented at the application layer, as opposed to operating at network layer (IPSec Implementation)

Secure Hypertext Transfer Protocol (S/HTTP) -As an application layer protocol, S/HTTP transmits individual messages or pages securely between a web client and server by establishing SSL-type connection. Using the https:// designation in the URL, instead of the standard http://, directs the message to a secure port number rather than the default web port address. This protocol utilizes SSL secure features but does so as a message rather than the session-oriented protocol.

The following reference(s) were/was used to create this question:
