allows remote communication between two networking devices. With Telnet use being as common as it is, you had better know the details of how to configure it in order to pass your CCNA exam and to work in real-world networks.

The basic concept is pretty simple - we want to configure R1, but we're at R2. If we telnet successfully to R1, we will be able to configure R1 if we've been given the proper permission levels. In this CCNA case study, R2 has an IP address of 172.12.123.2 and R1 an address of 172.12.123.1. Let's try to telnet from R2 to R1.

```
R2#telnet 172.12.123.1 Trying 172.12.123.1 ... Open Password
required, but none set [Connection to 172.12.123.1 closed by
foreign host]
```

This seems like a problem, but it's a problem we're happy to have. A Cisco router will not let any user telnet to it by default. That's a good thing, because we don't want just anyone connecting to our router! The "password required" message means that no password has been set on the VTY lines on R1. Let's do so now.

```
R1(config)#line vty 0 4
```

```
R1(config-line)#password baseball
```

A password of "baseball" has been set on the VTY lines, so we shouldn't have any trouble using Telnet to get from R2 to R1. Let's try that now.

```
R2#telnet 172.12.123.1
```

```
Trying 172.12.123.1 ... Open
```

```
User Access Verification
```

```
Password:
```

```
R1&gt;
```

We're in, and placed into user exec mode.

### **NEW QUESTION: 3**

You use Windows Deployment Services (WDS) to deploy Windows operating system images.

You create a custom image of Windows Preinstallation Environment (Windows PE).

You need to ensure that client computers use Pre-Boot Execution Environment (PXE) to load the Windows PE image.

To which node in the Windows Deployment Services console should you add the image?

- A. Multicast Transmissions
- B. Legacy Images
- C. Boot Images
- D. Pending Devices
- E. Install Images

**Answer: C**
