NEW QUESTION: 2

The risk manager is reviewing a report which identifies a requirement to keep a business critical legacy system operational for the next two years. The legacy system is out of support because the vendor and security patches are no longer released. Additionally, this is a proprietary embedded system and little is documented and known about it. Which of the following should the Information Technology department implement to reduce the security risk from a compromise of this system?

- A.** Hire developers to reduce vulnerabilities in the code.
- B.** Virtualize the system and migrate it to a cloud provider.
- C.** Install an antivirus and HIDS on the system.
- D.** Segment the device on its own secure network.

Answer: D

Explanation:

The question states that the application is a proprietary embedded system and little is documented and known about it. If we don't know much about the application or system, we should not make any changes to the system.

The best solution would be to isolate the system by segmenting the device on its own secure network. This will reduce the risk of a compromise of the system without making changes to the system itself.
